Sector: Agri-Food

Areas of Intervention & Priorities 2021-2027

Areas of intervention	Priorities
1. Improvement of primary	Promoting and improving the characteristics of Greek
production	primary production to boost its competitiveness
-	Evaluation, promotion and improvement of genetic
	material (of plants and animals, with an emphasis on
	native species)
	Innovative and emerging crops for production of
	products with or without added value (livestock
	farming, industrial crops, medicinal and aromatic
	plants, nutrient-dense plants/superfoods)
	Innovative technologies (ensuring hygiene/quality;
	improvement of treatment and processing techniques;
	precision systems; remote monitoring technologies;
	advanced materials technologies; non-intensive plant
	product management systems; pest and disease
	diagnosis and control; integrated production and
	farming management systems; decision-making
	support systems)
	Holistic management (addressing climate change
	challenges; organic farming; biodynamic and biocyclic
	systems; promoting underused products and by-
	products of Greek raw materials; certifiable production
	systems)
2. Streamlining natural	Reducing inputs and production costs
resource management	
	Conservation, quality and management of water
	resources (innovative irrigation techniques; water
	footprint of crops and farming; protection from
	agrochemicals)
	Reducing the environmental footprint (across the
	whole agri-food chain) including alternative energy
	sources
	Protection of soil resources (erosion and chemical
	pollution control measures; measures to improve biological and physical characteristics of agricultural
	land)
	Streamlining waste & by-product management and use
	(reducing the environmental footprint for energy
	generation and other uses)
	Agricultural and functional biodiversity (e.g. plant
	species mixtures; soil biodiversity; methods to enhance
	natural enemies and pollinators)
3. Nutrition, Health, Consumers	Nutrition policy (Greek diet; Mediterranean diet;
	health-protecting nutritional aspects; dietary
	behaviours among the population; special dietary
	senarious among the population, special dietal y

	needs & preferences of population segments;
	contemporary nutrition trends)
	(including consumers)
	Dietary approaches for non-communicable diseases
	(e.g. boosting immunity; preventing child obesity and
	comorbidities; gut microbiome and nutrition)
	Use of high-performance and analysis technologies
	(multi-omics, e.g. genomics, transcriptomics,
	metabolomics, metagenomics, etc.) in nutrition
	Food reformulation & production of food with
	improved bioactive characteristics (reduced use of
	additives/processing aids; addressing common causes
	of non-communicable diseases)
	Studies on standards, certification and labelling of agri-
	food products
	Personalized nutrition for specific population groups:
	covering increased nutrition needs and special needs of
	population groups (including children, menopausal
	women, seniors, athletes, vegans)
	Biological activity of food ingredients and human
	health (enhancing Greek biodiversity; promoting
	traditional Greek products to ensure sufficient nutrient
	intake; and promoting alternative protein sources)
	Improving consumer awareness – Promoting
	behavioral changes among consumers towards
	responsible and sustainable patterns of consumption
	and production:
	 Using state-of-the-art analysis &
	communication technologies and data
	collection platforms.
	 Developing tools to analyze scientific
	information for consumer knowledge
	 Informational/educational actions
	 Consumers and food waste reduction
4. Food safety	Food safety "mapping" (monitoring/assessment) and
-	
	optimization technologies, risk assessment strategies:
	optimization technologies, risk assessment strategies:Utilization of tools to harmonize food labelling
	 optimization technologies, risk assessment strategies: Utilization of tools to harmonize food labelling (including date marking) with applicable
	 optimization technologies, risk assessment strategies: Utilization of tools to harmonize food labelling (including date marking) with applicable legislation
	 optimization technologies, risk assessment strategies: Utilization of tools to harmonize food labelling (including date marking) with applicable legislation Industrial-scale application of "new" mild food
	 optimization technologies, risk assessment strategies: Utilization of tools to harmonize food labelling (including date marking) with applicable legislation Industrial-scale application of "new" mild food quality and safety technologies
	 optimization technologies, risk assessment strategies: Utilization of tools to harmonize food labelling (including date marking) with applicable legislation Industrial-scale application of "new" mild food quality and safety technologies [nanotechnology, alternative mild (non-
	 optimization technologies, risk assessment strategies: Utilization of tools to harmonize food labelling (including date marking) with applicable legislation Industrial-scale application of "new" mild food quality and safety technologies [nanotechnology, alternative mild (non- thermal) processing methods] and linking with
	 optimization technologies, risk assessment strategies: Utilization of tools to harmonize food labelling (including date marking) with applicable legislation Industrial-scale application of "new" mild food quality and safety technologies [nanotechnology, alternative mild (non- thermal) processing methods] and linking with the regulatory framework
	 optimization technologies, risk assessment strategies: Utilization of tools to harmonize food labelling (including date marking) with applicable legislation Industrial-scale application of "new" mild food quality and safety technologies [nanotechnology, alternative mild (non- thermal) processing methods] and linking with the regulatory framework Novel (natural) conservatives – search for
	 optimization technologies, risk assessment strategies: Utilization of tools to harmonize food labelling (including date marking) with applicable legislation Industrial-scale application of "new" mild food quality and safety technologies [nanotechnology, alternative mild (non- thermal) processing methods] and linking with the regulatory framework Novel (natural) conservatives – search for bioactive molecules from sustainable (e.g.
	 optimization technologies, risk assessment strategies: Utilization of tools to harmonize food labelling (including date marking) with applicable legislation Industrial-scale application of "new" mild food quality and safety technologies [nanotechnology, alternative mild (non- thermal) processing methods] and linking with the regulatory framework Novel (natural) conservatives – search for bioactive molecules from sustainable (e.g. water) environments –bioconversion of waste
	 optimization technologies, risk assessment strategies: Utilization of tools to harmonize food labelling (including date marking) with applicable legislation Industrial-scale application of "new" mild food quality and safety technologies [nanotechnology, alternative mild (non- thermal) processing methods] and linking with the regulatory framework Novel (natural) conservatives – search for bioactive molecules from sustainable (e.g.

r
 Developing green production systems to produce safe, long-life, high nutritional value and low environmental footprint food Utilizing agricultural by-products and/or coproducts, as well as food industry by-products to produce safe and healthy food and animal feed Reducing food waste and introducing sustainable food waste recycling processes to produce safe and healthy food and animal feed Planning & development of meal safety and nutritional value interventions in the catering isolated environmental for the produce safe and healthy food and animal feed
 industry using state-of-the-art tools.
 Tools for communication and consumer involvement in food safety: Developing strategies, interactive tools and applications to promote consumer information and their active involvement in food safety. Educating consumers to identify hazards concerning a) safety and b) quality, and to understand information on labels regarding the conservation and handling of food. Exploring consumer trends regarding safety as well as alternative approaches to food (e.g veganism).
 Application of state-of-the-art food safety and food quality tools Actions to eradicate food fraud & adulteration of food, by actively tracking risk across the food supply chain Developing genetic and digital markers/footprints for food production certification using practices that have been shown to maximize safety and promote their specific commercial (national and traditional) comparative advantages. – Digitalization of food safety monitoring; electronic platforms for bulk data harmonization and management Application of state-of-the-art technologies (bioinformatics, big data analysis, remote sensing, blockchain technology, RFID tags, Internet of Things) – -Applications of -omic technologies in food safety: Genomics (Whole Genome Sequencing/Next Generation Sequencing), transcriptomics (MAI DI-TOF).
Proteomics and Metabolomics (MALDI-TOF).
 Identifying and addressing existing and emerging food safety issues & introducing state-of-the-art strategies for risk assessment: Identifying existing & emerging hazards (hazard analysis) and food safety issues based

	 on novel search technologies (software tools and databases). Impact of climate change on food safety due to emerging hazards. Risk assessment using all available data
	worldwide, legislation, related literature,
	experience, as well as specific conditions and processing stages, for hazard prevention and
	monitoring measures taking into account the
	historical character of data
	Structured food safety strategies and state-of-
	the-art hazard and crisis management models
	based on hazard monitoring, re-evaluation and assessment.
5. Food Industry 4.0 –	State-of-the-art agricultural and food product
Processing Technologies	packaging, manufacturing, post-harvest preservation,
	active/intelligent packaging:
	Biodegradable and recyclable plastic
	packaging/Reduction of packaging plastics
	 Internet of Things (IoT) and other "intelligent" packaging applications
	 Packaging applications Packaging informing consumers about the
	safety of the food product
	 Active packaging – Bio-preservation
	Utilization of emerging/state-of-the-art technologies
	(e.g, IoT, blockchain, AI, Big Data) across the agri-food chain (primary production, processing, standardization, labelling, packaging, cortification, storage, distribution
	labelling, packaging, certification, storage, distribution, traceability, consumer information systems):
	Utilization of state-of-the-art technologies
	(blockchain, IoT, Augmented Reality, big data
	analytics, machine learning, etc.) to apply
	state-of-the-art food traceability, certification,
	storage and distribution systems, as well as
	consumer information systems.
	 Use of IoT and data analytics sensors and sensition to monitor warehouses and food
	services to monitor warehouses and food logistics
	 Traceability and digital certification services
	from "farm to shelf" incorporating blockchain
	Robot machinery and robotic automation applications
	Biosensors (to ensure quality, safety and authenticity
	of food during production and processing),
	biotechnology methods and microbial fermentation
	systems Organoleptic assessment and improvement (enhancing
	and utilizing ingredients with a direct impact on the organoleptic characteristics; methodologies reinforcing or weakening their effects across the chain in order to
	improve quality and/or create new products).

	State-of-the-art cost-reducing and productivity-
	increasing technologies in food processing
6. Sustainable Production	Responding to social crises and challenges (self-
o. Sustainable Froudetion	sufficiency and resilience of supply chain):
	 Current, medium- and long-term social crises and challenges (including self-sufficiency of
	communities, response to crises such as COVID-19)
	 Population growth and simultaneous depletion of resources (in nutrients and/or energy) and biodiversity
	"Do more with less" farming techniques
	Sustainable production & Sound environmental management:
	Reduction of energy consumption
	 Utilization of renewable energy source systems
	 Streamlining of waste management
	 Implementation of circular economy systems
	 Development of new products based on a low
	environmental footprint
	Environmental impact mitigation
	Emergency risk reduction
	 Promoting sustainable food consumption
	among consumers
	 Using state-of-the-art ICT-based production
	technologies to improve sustainability of
	production in terms of resources, materials
	and energy consumed.
	 Digital monitoring and certification of
	sustainable practices (energy use, GHG
	emissions).
	High-nutritional value products & natural environment
	sustainability:
	Promoting production of high nutritional value
	food products compatible with the modern lifestyle
	 New approaches, methods, technologies for
	production of high nutritional value, safe food
	respecting sustainability of the natural
	environment (reduced environmental
	footprint; reduced use of chemicals and
	practices harmful for humans, animals and the
	environment at large; local production chains;
	co-product/by-product utilization)
	Production of high nutritional value food
	products and promotion of nutrition models
	that are compatible with the modern lifestyle,
	contribute to health and well-being, rely on a
	better use of local/national production
	capabilities and take into account not only the

contexts.Circular business models and value chainsSupply chain (including interventions for supply chains of products which are of particular importance to Greece, as well as supply chains inclusive of vulnerable groups).Food waste reduction across the production and supply chainsSustainable food packaging (reduced environmental footprint of food packaging; development of cost vs environmental impact models for packaging; improvement of packaging technology; recyclable packaging; packaging materials; biodegradable packaging).7. Fisheries - AquacultureGovernance models for fisheries & aquaculture (environmental management; climate crisis adaptation; multi-use of the marine space)Animal health & welfare
Supply chain (including interventions for supply chains of products which are of particular importance to Greece, as well as supply chains inclusive of vulnerable groups). Food waste reduction across the production and supply chains Sustainable food packaging (reduced environmental footprint of food packaging; development of cost vs environmental impact models for packaging; improvement of packaging technology; recyclable packaging; packaging materials; biodegradable packaging). 7. multi-use of the marine space) Animal health & welfare
Animal health & welfare
(preventive and non-invasive treatments;
strengthening resilience against pathogens; stress in
cultivated organisms; natural antimicrobial agents)
Production efficiency improvement
(precision culture; production technology adaptations;
reduction of discarding and utilization of by-products) Alternative raw materials for aquaculture feeds
(availability and safety; preparation of cultivated
organisms; special nutrition products; nutritional status
indicators for organisms)
Aquaculture biotechnology
(special nutrition products; polyculture; new species
production)
Social dimension of aquaculture
(product quality & safety; improving acceptance of
aquaculture products; aquaculture & fisheries
environmental footprint)
